COVID-19 vaccines are safe, even though they were developed quickly.

No steps were skipped developing COVID-19 vaccines. Scientists around the world have been working on this technology for more than a decade. This is why it was possible to make a safe and effective vaccine available very quickly.

COVID-19 vaccines may protect you against more than one strain of the virus.

Viruses change, or develop small mutations, over time. Data shows COVID-19 vaccines are effective against the strains we've seen so far of the virus that causes COVID-19.

COVID-19 vaccines don't change your DNA.

COVID-19 vaccines are mRNA vaccines and don't interact with your DNA in any way. They trigger an immune response that creates antibodies to protect you from getting infected with COVID-19.

COVID-19 vaccines have not been linked to infertility or miscarriage.

COVID-19 hasn't caused infertility in women who've had the virus, so there's no reason to think the vaccine would cause it. There was some information spread online that was **not true**; saying that the protein in the vaccine attacks a protein in the placenta. **This is not true.** The small number of amino acids in the two proteins would not cause that effect. COVID-19 vaccines haven't been tested in pregnant women, but pregnant women do get vaccinated for other illnesses during pregnancy. Pregnant women have an increased risk for severe illness from COVID-19 and there is a chance you could give COVID-19 to your baby after he or she is born. Talk to your doctor to see if you should get vaccinated.
